Diaphragm Accumulators

ELM from 140 to 350 bar

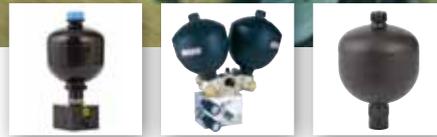

ENGINEERING YOUR SUCCESS.

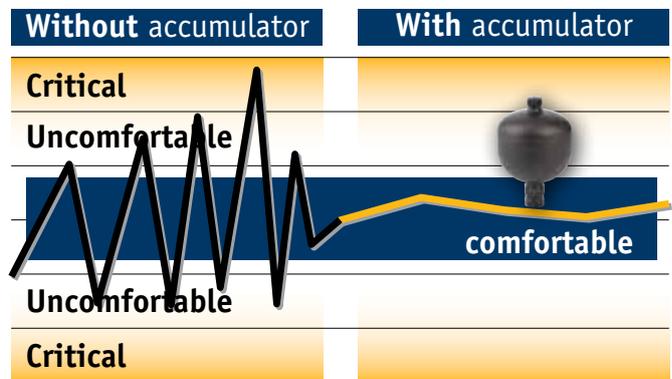

Day to day, the agricultural, forestry, construction and public works sectors are faced with the fundamental question:

How to enhance driver and vehicle comfort?

Thanks to our comprehensive range of diaphragm accumulators, we offer our customers flexibility of driving at record speeds while guaranteeing enhanced machinery longevity.

Comparative cycle for a tractor and its accessories in working conditions !

*Study carried out in cooperation with one of the largest manufacturers of agricultural machinery

Speed 50 kph

Load variation on front axle 3,5 to 100 %

An example*

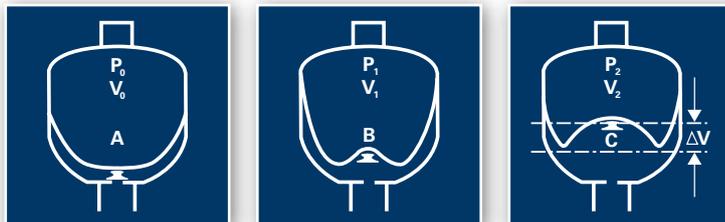

of application

Faced with difficult working conditions, a farm supervisor wants to **increase his driving comfort and reduce breakage** among his fleet of machines.

Main Features

Operation principle

Operation of the Parker Olaer gas loaded diaphragm accumulator is based on the considerable difference in compressibility between a gas and a liquid, enabling a large quantity of energy to be stored in an extremely compact form. This enables a liquid under pressure to be accumulated, stored and recovered at any time.

V0 = Capacity in nitrogen of the accumulator	P0 = Initial preload of the accumulator
V1 = Gas volume at the minimum hydraulic pressure	P1 = Gas pressure at the minimum hydraulic pressure
V2 = Gas volume at the maximum hydraulic pressure	P2 = Gas pressure at the maximum hydraulic pressure
ΔV = Returned and/or stored volume of working fluid between P1 and P2	

A - The diaphragm is in the pre-charge position, which means that it is only filled with nitrogen. The knob closes the hydraulic orifice and prevents the destruction of the diaphragm.

B - Position at the minimum operating pressure : there must be a certain amount of fluid between the diaphragm and the hydraulic orifice, such that the knob does not close the hydraulic orifice. Thus, P0 must always be < P1.

C - Position at the maximum operating pressure: the volume change ΔV between the minimum and maximum positions of the operating pressures represents the fluid quantity stored.

Your Benefits

The adaptation of a hydraulic shock absorber made up of a diaphragm accumulator improves driver comfort and offers immediate response times when driving over obstacles and the same flexibility for variable operating conditions.

0 < speed < 50 kph

3.5 < load variation < 100%

Identical flexibility depending on your use.

The same EC pressure directive (PED) compliant accumulator can be used in over 35 destination countries, thus facilitating their free movement.

In addition all our ELM diaphragm accumulators have SELO approval for China.

Technical Characteristics

The technical characteristics are as follows:

Minimum/maximum temperature allowable (° Celsius) :

- 20/+ 80 for standard nitrile elastomers for models 0.075 ≥

1.4 Litre

- 10/+ 80 for standard nitrile elastomers for models ≥ 2 Litres

- 35/+ 80 for hydrin elastomers

Materials : carbon steel or stainless steel, nitrile or hydrin diaphragm, for other constructions: consult Parker Olaer.

How to size?

Parker Olaer has developed a very sophisticated simulation software to optimize accumulator sizing recommendations. The behaviour of accumulators used in applications such as pulsation dampening, surge alleviation, thermal expansion and energy storage can be simulated. Our software can be downloaded from our website (www.parker.com/acde). You may also contact your local Parker Olaer office for sizing assistance.

This sizing chart can be used, on the basis of the arrangement of the various parameters, to determine the volume of oil available, the size of the accumulator or the pressures. It does not take account of the correction for actual compressibility of the real gas, the actual adiabatic coefficient or the polytropic coefficient of the application. Depending on the conditions of use, these can have a significant effect and may entail the need for certain corrections.

We recommend

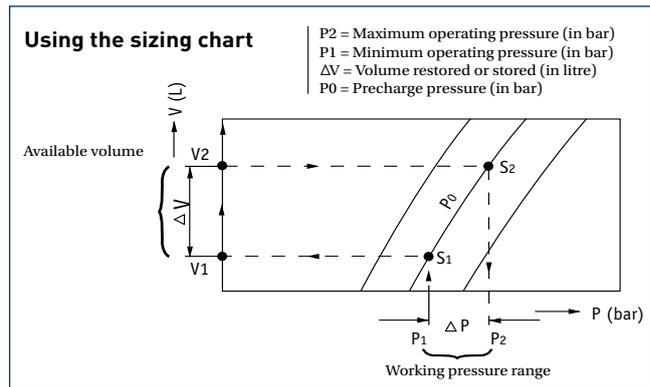

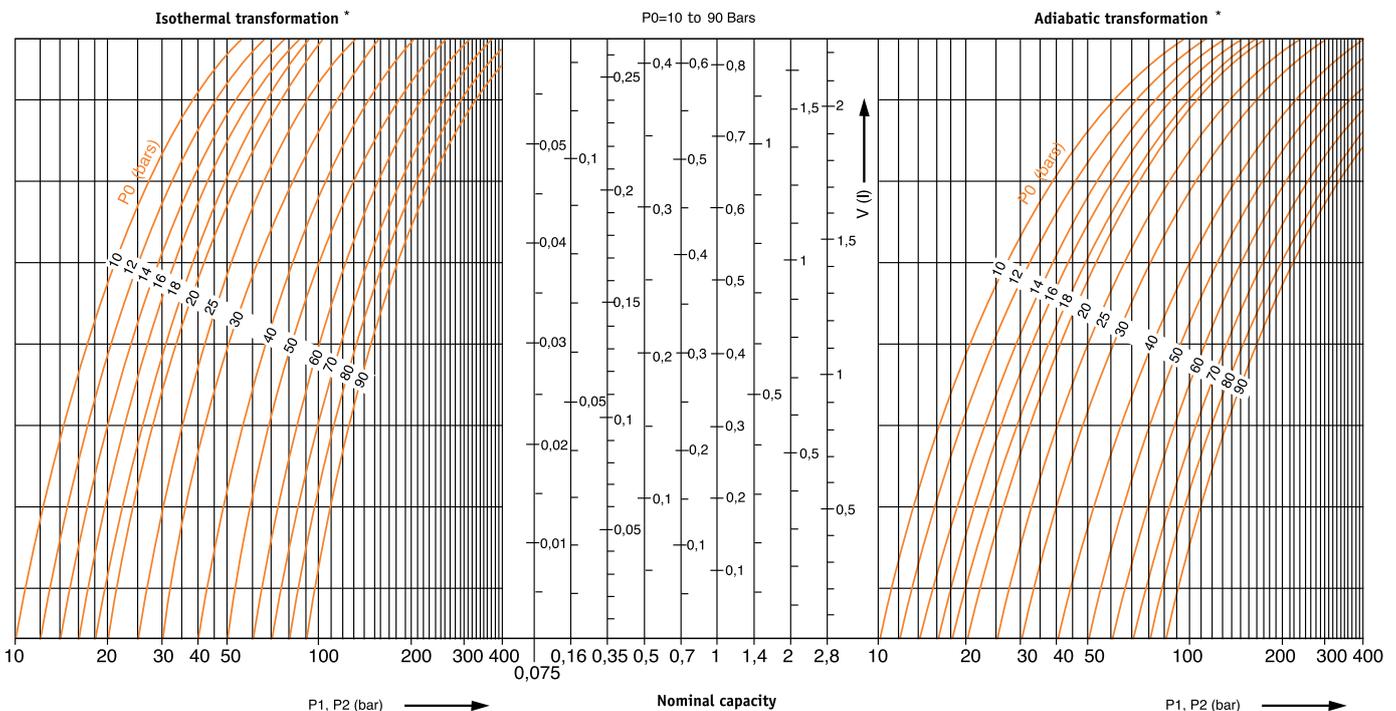

In load dampening configuration: $P_0 = 0,6 - 0,9 P_m$

(P_m = average working pressure)

Pulsation dampening: $P_0 = 0,6 - 0,8 P_m$ (P_m = average working pressure)

Energy storage: $P_0 = 0,9 P_1$ (P_1 = minimum working pressure)

Energy storage calculation sizing chart

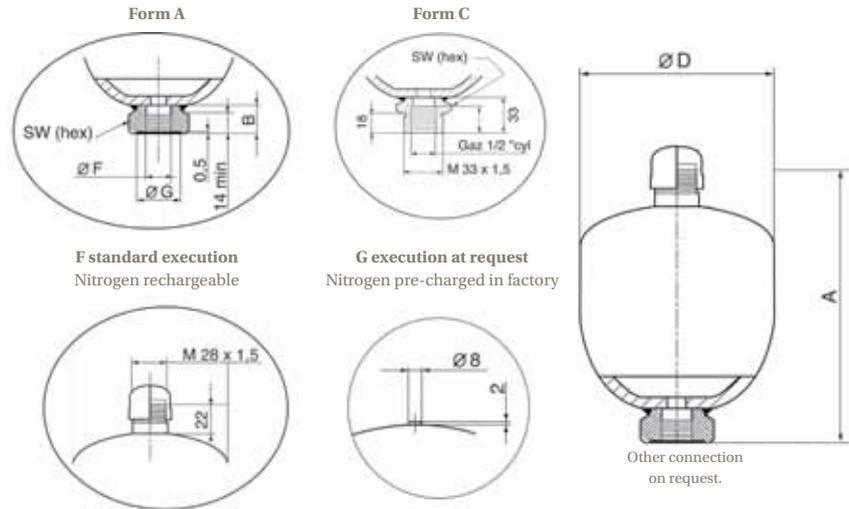

***Reminder**

Isothermal: The transformation is said to be isothermal when the compression or expansion of the gas occurs at a rate slow enough to allow a good thermal exchange, allowing the gas to remain at constant temperature.

Adiabatic: The transformation is said to be adiabatic when the cycle is quick and does not allow a temperature exchange with the ambient media.

M45	1.5	70	80.8	10

Above dimensions are in mm and are subject to manufacturing tolerances.
These accessories are designed so that the accumulator can be securely attached in all configurations.

Charging set VGU

The VGU universal tester and presurizer is an indispensable instrument for the verification, pressurization and nitrogen bleeding of most of the hydraulic accumulators available on the market. To use this unit, it is screwed on the inflation valve of the accumulator and connected via a high pressure hose to the nitrogen source, equipped with a pressure reducer. If only the nitrogen pressure is to be controlled or reduced, this hose is not necessary

The standard set is delivered in a storage case containing the following:
VGU universal tester and pressuriser (end M28x1.50)

- Pressure gauge kit from 0 to 25 bar
- Pressure gauge kit from 0 to 250 bar
- Connection adapters for inflation valves (7/8" - 5/8" - 8V1 - M28x1.50)
- High pressure hose, 2.5 m long, for connecting to a nitrogen source
- Hexagon socket screw key 6 mm
- Seal Kit
- Operating instruction in French, English, German

Note:

The following options are available on request:

Pressure gauge kits with different scale divisions: 63 mm with glycerol filled back end G1/4" cyl. equipped with direct gear for Minimesse® connection. Scale divisions 0-10, 0-60, 0-100, 0-400, with accuracy class 1.6%.

High pressure hose of different length with adapters for nitrogen bottles from various countries (specify country), at each end with a female swivel coupling G1/4" for connecting to the inflation port
Maximum working pressure: limited by the maximum operating hydraulic system, pressure limited to **400 bar in any case.**

Ordering code - Example:

VGU/F 25/250 7 TS2 3
25/250 = Gauges, possible choice between pressure ranges 6/10/25/60/100/160/250/400

Safety Blocks

Are designed to incorporate in a single compact block a variety of functions necessary for the correct operation of a hydraulic system fitted with accumulators. This includes manual and/or electrical drain, isolation, flow control and pressure relief.

Channel cross section : 10 mm (DI 10 block), 20 mm (DI 20 block).

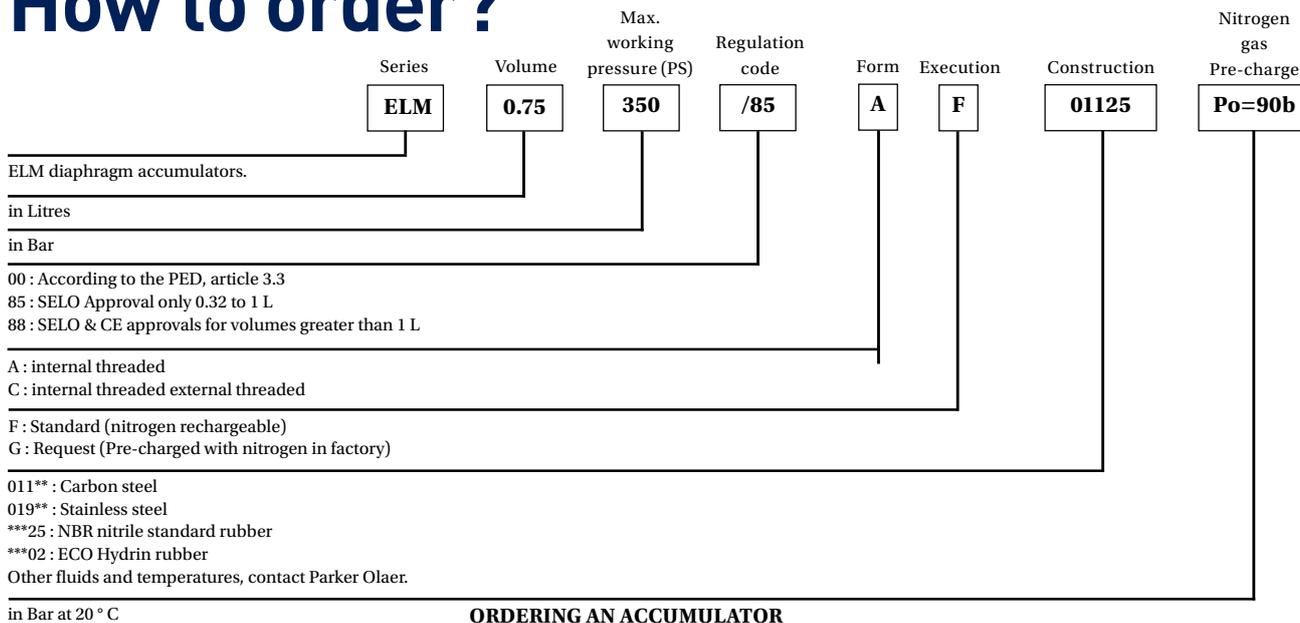

Maximum working pressure : 330 to 690 Bar depending on models. According with the fluids of group 2 (PED). Options for ATEX compliant blocks construction carbon steel or stainless steel. A specific data sheet is available on request, please contact Parker Olaer.

Function Blocks

Parker Olaer has a broad range of function blocks adapted to your specific use. Contact Parker Olaer for further information.

How to order?

ORDERING AN ACCUMULATOR

Please indicate type for accessories as per tables on page 6, and for peripheral materials.

Installation

Position: Preferably vertical (liquid connection downwards) to horizontal, depending upon application. If the accumulator is installed in any position other than vertical with fluid port down, contact Parker Olaer. The accumulator could have reduced volumetric efficiency and Parker Olaer can help you to take these factors into account.

Mounting: A 200mm clearance is required above the accumulator to allow for gas charging. Each accumulator is delivered with a user instructions leaflet. Ensure that the pipes connected directly or indirectly to the accumulator are not subjected to any abnormal force, Ensure that the accumulator cannot move, or minimise any movement that may occur as a result of broken connections. Parker Olaer clamps and brackets are designed for this purpose (and can be supplied as optional extras). The accumulator must not be subjected to any stress or load, in particular from the structure with which it is associated. Contact Parker Olaer in case of mounting on the movable structures.

IT IS STRICTLY FORBIDDEN TO

- Weld, screw or rivet anything onto the accumulator body.
- Operate in any way that may alter the mechanical properties of the accumulator.

- Use the accumulator for construction purposes. (No stress or loading)
- To modify the accumulator without prior approval from the manufacturer.

GAS FILLING

For safety reasons, use only pure nitrogen, minimum 99.8% purity. In most of the cases the pre-charge pressure is between 0,9 P1 and 0,25 P2. Your local Parker Olaer office can calculate the correct pre-charge pressure for your application.

Parker Olaer offers a range of devices for checking nitrogen pressure as well as pre-charging accumulators. Please note that various adaptors are required to interface with different accumulator filling valves and nitrogen (N2) cylinder connections throughout the world.

The part number defines the accumulator and the material construction.

Information contained on the labeling/ manufacturer's plate:

- Parker Olaer logo
- Reference Parker Olaer
- Volume
- Max. allowable working Pressure (PS)
- Working temperature range (TS)
- Parker Olaer SELO Identification

- Test pressure (PT)
- Fluid group (1 or 2 according to the PED Directive 97/23/EC)
- Gas
- Pre-charge pressure
- Serial production n°
- Parker Olaer Warning Label

Maximum allowable operating pressure

The maximum pressure (PS) is indicated on the accumulator. Check that the maximum allowable pressure is greater than that of the hydraulic system. For any other pressure, you will have to contact Parker Olaer.

Maximum allowable operating temperature

The temperature range (TS) is indicated on the accumulator. Check that the allowable temperature range covers the operating temperatures (environment and hydraulic fluid temperatures). For any other temperature, you will have to contact Parker Olaer.

Maintenance

Any intervention, maintenance, repair must be carried out by a qualified and trained personnel.
